Insertion Sort Analysis in Java

Preston Stosur-Bassett

Abstract

The present study investigates the insertion sort sorting algorithm and how it performs on data sets of different sizes when implemented in Java. Insertion sort is a sorting algorithm that runs in $\theta(n^2)$. For sorting large sets of data, insertion sort does not perform exemplary, however, for simple sorting of data sets under 10,000, insertion sort performs reasonably quickly on modern day computers.

I. Motivation

In order to show how an algorithm might run on a given set of hardware, and how the algorithm will perform when given large amounts of data, algorithms are analysed. More specifically, insertion sort is analysed to determine what the run time might be for sorting large amounts of data on any modern computer.

II. Background

A sorting algorithm is used to sort data with a natural order. One such sorting algorithm is insertion sort, which sorts by iterating through a list of data, taking the current position, and repositioning it into a more appropriate place in the list. How will this procedure perform when handling high volumes of data? How will it perform when executed on different machines? Because insertion sort is a more basic sorting algorithm, numerous papers and articles have been written answering these two questions.

III. Procedure

An insertion sort can be implemented in a multitude of languages using the pseudocode provided below.

Insertion Sort Pre-Condition: A is a non-empty array of data with a natural order.

Insertion Sort Post-Condition: A' is a permutation of A (containing all the same elements) in strictly non-decreasing order.

Outer-Loop Invariant: The subarray A'[1 ... i - 1] contains all the same elements as the subarray A[1 .. i - 1].

Outer-Loop Initialization: The outer-loop invariant holds because A'[1 ... i - 1] and A[1 ... i - 1] both contain the same one element.

Outer-Loop Maintenance: The outer-loop invariant holds because A'[1 ... i - 1] and A[1 ... i - 1] both contain the same elements, although they may be in different orders.

Outer-Loop Termination: When the outer-loop terminates, i = A.length, which implies that the entire array has been traversed and the guard has been negated. The negation of the guard implies that A'[1 ... i - 1] contains all the elements in A[1 ... i - 1].

Inner-Loop Invariant: A'[1 ... j] is sorted in strictly non-decreasing order.

Inner-Loop Initialization: Before the first iteration of the loop, j = 1, meaning the subarray A'[1 ... j] contains exactly one element, which is already sorted.

Inner-Loop Maintenance: At the beginning of each iteration of the loop the inner-loop invariant holds because j counts down from i, and A'[j+1] is swapped with A'[j] only if A'[j+1] is less than A[j].

Inner-Loop Termination: The negation of the guard implies that j = A.length and that A'[1 ...

Algorithm 1 INSERTION-SORT(A)

1: **procedure** INSERTION-SORT(A)
2:      **if** $A.length <= 1$ **then**
3:          **return** A
4:      **end if**
5:      $i = 2$
6:      **while** i upto $A.length$ **do**
7:          $key = A[i]$
8:          $j = i - 1$
9:          **while** j downto 1 and $key < A[j]$ **do**
10:             $A[j + 1] = A[j]$
11:             $j = j - 1$
12:         **end while**
13:         $A[j + 1] = key$
14:         $i = i + 1$
15:     **end while**
16: **end procedure**

---

j] has been entirely traversed and sorted in strictly non-decreasing order, which maintains the inner-loop invariant.

Conclusion: The termination of both the inner and outer loops implies that the entire array has been traversed, A' is a permutation of A containing all the same elements in strictly non-decreasing order. This satisfies the post condition.

IV. TESTING

A. Testing Plan and Results

All arrays used in testing are Java ArrayList<Integer> unless otherwise specified. All times are recorded in milliseconds using a stopwatch class borrowed from Robert Sedgewick and Kevin Wayne [3]. It is important to note that the stopwatch class used takes the elapsed real-time between the start of the insertion sort algorithm and the end of the insertion sort algorithm as opposed to taking the elapsed processor-time because these tests were run on a multi-core computer. In the table below, A denotes Array. Times in the table below are given as averages out of 10 trials.

Table I
TEST RESULTS

Tested Input	Expected Results	Actual Results	Time
Empty A	Empty A	Empty A	0.0003
A of 1000 Strings	Sorted A 1000 Strings	Sorted A 1000 Strings	0.021
A 1 Element	Original A	Original A	0.0003
A 10 Elements	Sorted A 10 Elements	Sorted A 10 Elements	0.0005
A 100 Elements	Sorted A 100 Elements	Sorted A 100 Elements	0.0021
A 1000 Elements	Sorted A 1000 Elements	Sorted A 1000 Elements	0.019
A 10000 Elements	Sorted A 10000 Elements	Sorted A 10000 Elements	0.129
A 100000 Elements	Sorted A 100000 Elements	Sorted A 100000 Elements	6.4923
A 1000000 Elements	Sorted A 1000000 Elements	Sorted A 1000000 Elements	2135.5007
A 10000000 Elements	Sorted A 10000000 Elements	OS Crash	N/A
A 1000 Identical Elements	Original Array	Original Array	0.0052

B. Problems Encountered

One major issue encountered during the development of this insertion sort was that after completing the sort, A' was sorted properly except for the first element in the array. No matter what value the first element of A had, it did not change position in A'. For example, if A[5, 6, 3, 4, 7] was passed to the insertion sort algorithm, the returned array would look like A'[5, 3, 4, 6, 7]. Changing the guard for the inner for loop (see Algorithm 1 line 6) from *key < A[j] and j downto 1* to *j downto 1 and key < A[j]* corrected this issue.

Another issue encountered during the development of this program was executing Java *assert* statements. When assertions were wrapped in parenthesis, they evaluated to a boolean, and the assert would throw an *AssertionError* with the explanation 'cannot compare to boolean'. Removing the parenthesis wrapping the assertion fixed this issue.

The last issue encountered during the development process of this program was generic programming. The program would not compile because not all Objects have a compareTo method. Adding the statement *< T extends Comparable < T >>* fixed this issue. [2]

V. Experimental Analysis

The insertion sort demonstrated in Algorithm 1 was implemented in Java and executed on an HP SprectreXT TouchSmart with 4 Core Intel i7 processor clocked at 1.9GHz running Ubuntu Gnome 14.10 64-bit.

The expected growth of insertion sort as the number of elements (n) grows large can be represented as $\theta(n^2)$ where $\theta()$ represents the asymptotically tightly bound running time. [1] At n_0 the algorithm took 0.0003 milliseconds to complete. At n_1 the algorithm also took 0.0003 milliseconds to complete. For both these values of n, the algorithm runs at $\theta(1)$, which is a constant value because the algorithm completes before a loop is run. As n grows larger the time to complete the experimental data correlates quite accurately with the expected growth. For n_{1*10^6} the data matches up perfectly. This is to be expected, because as n grows larger the constants and lower orders of the actual running time of the insertion sort start to affect the running time less and less as the highest order of n^2 is so large. It is expected for lower values of n to not correlate well with $\theta(n^2)$ because the system running the algorithm may be executing superfolous commands such as checking for system. For the data graphed above (see Fig. 1) this was in fact the case. To aid this issue, averages of 10 trails were taken and used in Figure 1.

VI. Conclusions

Insertion sort is not the best choice for sorting large amounts of data because as n grows large, it takes insertion sort $\theta(n^2)$ time to complete on modern day computers. Obviously, the faster the
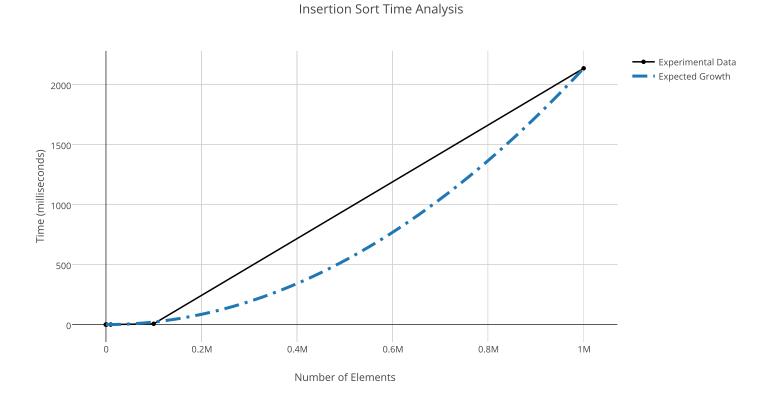

Insertion Sort Time Analysis

Figure 1. Insertion Sort Time Analysis

system executing insertion sort, the faster the algorithm will complete, however, with large enough values of n, it can take powerful systems quite a long amount of time to complete, as shown in Figure 1.

            return list;
    }

    /*
    *       @Description: identicalElement will take an element and
        add it to the ArrayList<Integer> for a given amount of times
    *       @param int end the ending value to denote when to stop
        adding elements to the array
    *       @param int element the element to add over and over again
        to the array
    *       @param ArrayList<Integer> list the list to add elements
        to
    *       @return ArrayList<Integer> the list after it has been
        updated with the given data
    */
    public static ArrayList<Integer> identicalElement(int end, int
        element, ArrayList<Integer> list) {
            // INVARIANT: A.length >= start
            int start = 0;
            Debug debugger = new Debug();
            //The element to add over and over again
            Integer iden = new Integer(element);
            // INITIALIZATION: Before the first iteration of th eloop
                , start = 0 and A.length cannot equal anything less
                than 0, so our invariant holds true
            debugger.assertGreatEquals(list.size(), start);
            while(start < end) {
                    // MAINTENANCE: At the beginning of each
                        iteration of the loop our invariant holds
                        because for each iteration of the loop one
                        element is added to A and start is incremented
```

```
                                by 1
                            debugger.assertGreatEquals(list.size(), start);
                            list.add(iden);

                            //Count up on the iterator
                            start++;
                    }
                    /* TERMINATION: The negation of the gaurd implies that (
                        end − start) number of elements hav ebeen added to A,
                        since start is initialied as 0 at the beginning of the
                        method and is
                                        incremented by 1 each iteration of the
                                            loop, which means that start amount of
                                            elements have been added to A, and so
                                            our invariant holds true      */
                    debugger.assertGreatEquals(list.size(), start);

                    return list;
            }
}
